## ANOVA

Donna Dietz

American University<br>dietz@american.edu

STAT 202 - Spring 2020

## ANOVA

## ANOVA

ANOVA stands for ANalysis Of VAriance (or VAriation).
It can also be called Fisher's analysis of variation.

## Ronald Fisher

Ronald Fisher introduced the term variance and proposed its formal analysis in a 1918 article The Correlation Between Relatives on the Supposition of Mendelian Inheritance. His first application of the analysis of variance was published in 1921. Analysis of variance became widely known after being included in Fisher's 1925 book Statistical Methods for Research Workers. (Wikipedia)

## Fisher

Portrait of Ronald Fisher as a young man 17 February 1890-29 July 1962

In his honor, we call the relevant curve family the $F$ distribution. (Don't forget George Snedecor's contributions though!)

## Think of it as a massive t-test

Since we've already covered Mr. Student (Gosset) and his tables, you can almost think of ANOVA as running all the possible t-tests on several groups at once, to see if there are any groups that differ. However, you should avoid doing all those t-tests anyhow.

There is no harm in doing ANOVA on two groups, and you should end up with the same $p$-value anyhow, so why bother with t-tests? (I honestly haven't the foggiest! I wouldn't use them!)

## Reminder

| Test | Data Type | Data Type |
| :--- | :--- | :--- |
| Linear Regression | Numerical | Numerical |
| Chi-Square | Categorical | Categorical |
| ANOVA | Categorical | Numerical |

## Recall...

When we found the standard deviation by hand, we used a similar process.
Use for $S S_{\text {Total }}$ and $S S_{W G}$.

- Calculate mean of data
- Find all deviations from the mean
- Square them all
- Add them all
- (Stop here this time!)

## Find $S S_{\text {Total }}$ and $S S_{W G}$

We are going to trace through a very simplistic example of ANOVA by hand and again on StatCrunch.

Group X: $\{1,3,5,7,9\}$
Group Y: $\{6,7,8,9,10\}$
Combined Groups: $\{1,3,5,7,9,6,7,8,9,10\}$

## SS WG

Group X: $\{1,3,5,7,9\}$ has $\mu=5$.

| $x$ | 1 | 3 | 5 | 7 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $x-\mu$ | -4 | -2 | 0 | 2 | 4 |
| $(x-\mu)^{2}$ | 16 | 4 | 0 | 4 | 16 |

All of those add up to 40 .
Group $Y:\{6,7,8,9,10\}$ has $\mu=8$.

| y | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $y-\mu$ | -2 | -1 | 0 | 1 | 2 |
| $(y-\mu)^{2}$ | 4 | 1 | 0 | 1 | 4 |

All of those add up to 10 .
Overall, that adds up to 50 .

$$
S S_{W G}=50
$$

StatCrunch calls this Error.

## $S S_{\text {Total }}$

Overall, the 10 items have a mean of 6.5 . This is sometimes called GM or the Grand Mean.

| 1 | 3 | 5 | 7 | 9 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| -5.5 | -3.5 | -1.5 | .5 | 2.5 | -.5 | .5 | 1.5 | 2.5 | 3.5 |
| 30.25 | 12.25 | 2.25 | .25 | 6.25 | .25 | .25 | 2.25 | 6.25 | 12.25 |
| The sum of these values is 72.5. |  |  |  |  |  |  |  |  |  |

$$
S S_{\text {Total }}=72.5
$$

StatCrunch calls this Total.

## $S S_{B G}$

What are those subscripts anyhow?
WG means "Within Groups"
BG means "Between Groups"
Total means overall, as if you didn't have groups at all.
For each group, we square the difference between the group mean and the Grand Mean, and multiply that by the number of items in the group.
Then, add the components from each group.
Group X: $5 \cdot(6.5-5)^{2}=5 \cdot(1.5)^{2}=11.25$.
Group $Y: 5 \cdot(6.5-8)^{2}=5 \cdot(1.5)^{2}=11.25$.
These have to be the same because we only have two groups and they are of the same size, so this should not be a surprise. Overall, we get 22.5.

$$
S S_{B G}=22.5
$$

StatCrunch calls this Columns.

## Shocking craziness!

| x | y | Analysis of Variance results: <br> Data stored in separate columns. <br> Column statistics |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 6 |  |  |  |  |  |  |  |  |  |
| 3 | 7 |  |  |  |  |  |  |  |  |  |
| 5 | 8 |  |  |  |  |  |  |  |  |  |
| 7 | 9 | Cxy | olumn 4 |  | $\dagger$ | Mean * |  | Std. Dev. ${ }^{\text {of }}$ |  | Std. Error ${ }^{\text {\% }}$ |
| 9 | 10 |  |  |  | 5 |  | 5 | 3.1622777 |  | 1.4142136 |
|  |  |  |  |  | 5 |  | 8 | 1.5811388 |  | 0.70710678 |
|  |  | ANOVA table |  |  |  |  |  |  |  |  |
|  |  | Source |  | DF |  | SS | MS | F-Stat | P-value |  |
|  |  | Columns |  | 1 | 1 | 22.5 | 22.5 | 3.6 | 0.09 | 943 |
|  |  | Error |  | 8 | 8 | 50 | 6.25 |  |  |  |
|  |  | Total |  | 9 | 9 | 72.5 |  |  |  |  |
|  |  | Tukey HSD results ( $95 \%$ level) <br> x subtracted from |  |  |  |  |  |  |  |  |
|  |  | Difference |  |  |  | Lower |  | Upper |  | P-value |
|  |  | y |  | 3 | 3 | -0.64 | 611269 | 96.646 | 61127 | 0.0943 |

$$
S S_{\text {Total }}=S S_{W G}+S S_{B G} .
$$

$$
72.5=50+22.5
$$

THIS IS INSANE!!! Of course, you get a p-value and confidence interval as always.

## BUT WHAT WAS THAT?

$$
S S_{\text {Total }}=S S_{W G}+S S_{B G}
$$

This looks very much like $\sigma_{A+B}^{2}=\sigma_{A}^{2}+\sigma_{B}^{2}$. It also reminds us of $A^{2}+B^{2}=C^{2}$.
What is going on!?!? I don't see any right triangles here!

## Pythagoras strikes again!

Please understand that it is not the case that this is true point-by-point. In other words, you cannot take just one point from the data set and expect this relationship to hold. It only holds in the aggregate!

Example: For the y-data point of 9, you would get a squared deviation from GM as $(9-6.5)^{2}$, or 6.25 . Your deviation from your group would be 1 , so squaring it would still give you 1 . The component from the group to the GM is 1.5 which becomes 2.25 . Notice that 6.25 is NOT equal to 3.75 ! But when you do this for all the data points and add up all the components, everything always balances out perfectly!

## Getting to the F-Statistic

Now that we've done the hard work, finding the F-Statistic is the easy part.

$$
\begin{aligned}
& n=\text { number of points } \\
& k=\text { number of groups }
\end{aligned}
$$

$$
\begin{gathered}
M S_{B G}=\frac{S S_{B G}}{k-1} \\
M S_{W G}=\frac{S S_{W G}}{n-k} \\
F=\frac{M S_{B G}}{M S_{W G}}
\end{gathered}
$$

Your degrees of freedom are split between the numerator $(k-1)$ and denominator ( $n-k$ ). You go to your F-tables and look up your p-value.
(Those tables are huge, though, so I'm providing them only on Blackboard. You can of course use StatCrunch also.)

## Back to the example

$$
\begin{gathered}
n=10 \\
k=2 \\
M S_{B G}=\frac{22.5}{1}=22.5 \\
M S_{W G}=\frac{50}{8}=6.25 \\
F=\frac{22.5}{6.25}=3.6
\end{gathered}
$$

For $d f=1$ in the numerator and $d f=8$ in the denominator, the F-statistic 3.6 gives a p-value on StatCrunch of about 0.0943 .

## Verifying...

## Stat $>$ Calculators $>\mathrm{F}$

And you should just include the Tukey test in case you do reject the Null.

## John Tukey

## John Tukey

John Wilder Tukey (June 16, 1915 - July 26, 2000) was an American mathematician best known for development of the Fast Fourier Transform (FFT) algorithm and box plot. The Tukey range test, the Tukey lambda distribution, the Tukey test of additivity, and the Teichmüller-Tukey lemma all bear his name. He is also credited with coining the term 'bit'. (Wikipedia)

## Example 2

To build some intuition, let's have two groups with the same mean.
Group X: $\{1,3,5,7,9\}$ still has $\mu=5$
Group $\mathrm{Y}:\{2,3,4,5,6,7,8\}$ also has $\mu=5$
Combined Groups: $\{1,3,5,7,9,2,3,4,5,6,7,8\}$ of course has $\mu=5$.

## What now?

| $\mathbf{x}$ | y |
| ---: | ---: |
| 1 | 2 |
| 3 | 3 |
| 5 | 4 |
| 9 | 5 |
| 9 | 6 |
|  | 7 |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

Analysis of Variance results:
Data stored in separate columns.
Column statistics
Column $\uparrow \mathrm{n} \uparrow$ Mean $\uparrow$ Std. Dev. $\uparrow$ Std. Error $\uparrow$

| x | 5 | 5 | 3.1622777 | 1.4142136 |
| :--- | ---: | ---: | ---: | ---: |
| y | 7 | 5 | 2.1602469 | 0.81649658 |

ANOVA table

| Source | DF | SS | MS | F-Stat | P-value |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Columns | 1 | 0 | 0 | 0 | 1 |
| Error | 10 | 68 | 6.8 |  |  |
| Total | 11 | 68 |  |  |  |

The $S S_{W G}$ component from Group X is the same as before, 40 .

| 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| -3 | -2 | -1 | 0 | 1 | 2 | 3 |
| 9 | 4 | 1 | 0 | 1 | 4 | 9 |
| The foup Y is 28. |  |  |  |  |  |  |

$$
S S_{W G}=40+28=68 .
$$

## Example 2

But it's obvious that this is identical to $S S_{\text {Total }}$ because all the subtractions were from 5 .

It is also obvious in this one case, that the between group component has to be zero, because their means are identical!

Since the $S S_{B G}=0$, the F -statistic will be zero. This gives us a p -value of 1 , which seems reasonable. There is nothing less extreme, so the chances of getting this result or something more extreme is all cases possible! That's 100\%.

## Example 3

Again, to build intuition, let's consider two groups that are identical but shifted by a large amount.

| $\mathbf{x}$ | y |
| ---: | ---: |
| 1 | 101 |
| 3 | 103 |
| 5 | 105 |
| 7 | 107 |
| 9 | 109 |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

| Analysis of | of Var |  | iance | sults |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Data stored | in s | s | parate | olum | mns |  |  |
| Column sta | tatisti | stic |  |  |  |  |  |
| Column * |  | \% | Mea | ¢ ${ }^{\text {S }}$ |  | Dev. $\%$ | Std. Error ${ }^{\text {\% }}$ |
| x |  | 5 | 5 | 5 |  | 1622777 | 1.4142136 |
| y |  | 5 | 5105 | 105 |  | 1622777 | 1.4142136 |
| ANOVA tabl | able |  |  |  |  |  |  |
| Source | DF |  | SS | MS | IS | F-Stat | P-value |
| Columns | 1 | 1 | 25000 | 2500 | 000 | 2500 | $<0.0001$ |
| Error | 8 | 8 | 80 |  | 10 |  |  |
| Total | 9 | 9 | 25080 |  |  |  |  |

We already know about Group $X$, so the $S S_{W G}$ is twice that for just Group $X$ or $40+40=80$. The two groups are perfectly separated by 100 units, for an average of 50 . The $S S_{B G}$ will then be ten times the square of 50 , or 25000 as shown in the table. Finding $S S_{\text {Total }}$ by hand is annoying, so let's skip that.

## Example 3

This time, $S S_{B G}$ and therefore $M S_{B G}$ is huge compared to $M S_{W G}$ which is tiny. The F-statistic will be huge and highly significant!

| $\mathbf{x}$ | y |
| ---: | ---: |
| 1 | 101 |
| 3 | 103 |
| 5 | 105 |
| 7 | 107 |
| 9 | 109 |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

| :--- | ---: | ---: | ---: | ---: |
| x | 5 | 5 | 3.1622777 | 1.4142136 |
| y | 5 | 105 | 3.1622777 | 1.4142136 |

ANOVA table

| Source | DF | SS | MS | F-Stat | P-value |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Columns | 1 | 25000 | 25000 | 2500 | $<0.0001$ |
| Error | 8 | 80 | 10 |  |  |
| Total | 9 | 25080 |  |  |  |

## Lots of groups

ANOVA is great for looking at lots of groups, so I'm going to do another experiment! I'm starting with some bogus temperature data in Fahrenheit, and I'm going to slowly slide the values and squish them together, so they become Celcius values. There is no deep reason for doing this, but I just want to see when ANOVA tells me I have different distributions!

## Underlying data

## Boxplots

D0-DTen: Transition from Fahrenheit to Celcius

## ANOVA Results

## Analysis of Variance results:

Data stored in separate columns.

## Column statistics

| Column $\uparrow$ | $\mathbf{n} *$ | Mean $\uparrow$ | Std. Dev. $\uparrow$ | Std. Error $\uparrow$ |
| :--- | ---: | ---: | ---: | ---: |
| D0 | 70 | 83.346504 | 22.815327 | 2.7269532 |
| D1 | 70 | 77.864437 | 21.801313 | 2.6057553 |
| D2 | 70 | 72.38237 | 20.787298 | 2.4845573 |
| D3 | 70 | 66.900303 | 19.773284 | 2.3633594 |
| D4 | 70 | 61.418236 | 18.759269 | 2.2421615 |
| D5 | 70 | 55.93617 | 17.745254 | 2.1209636 |
| D6 | 70 | 50.454103 | 16.73124 | 1.9997657 |
| D7 | 70 | 44.972036 | 15.717225 | 1.8785677 |
| D8 | 70 | 39.489969 | 14.703211 | 1.7573698 |
| D9 | 70 | 34.007902 | 13.689196 | 1.6361719 |
| DTen | 70 | 28.525835 | 12.675182 | 1.514974 |

ANOVA table

| Source | DF | SS | MS | F-Stat | P-value |
| :--- | ---: | :---: | :---: | :---: | :---: |
| Columns | 10 | 231408.54 | 23140.854 | 71.164021 | $<0.0001$ |
| Error | 759 | 246808.82 | 325.17631 |  |  |
| Total | 769 | 478217.36 |  |  |  |

The ANOVA results give $p<0.0001$ so it's highly significant. But since we have more than 2 groups, we don't know whom to blame!

## Tukey Analysis

Tukey HSD results ( $\mathbf{9 5 \%} \%$ level)
D0 subtracted from

|  | Difference | Lower | Upper | P-value |
| :--- | :---: | :---: | :---: | ---: |
| D1 | -5.4820668 | -15.32297 | 4.3588361 | 0.781 |
| D2 | -10.964134 | -20.805037 | -1.1232307 | 0.0151 |
| D3 | -16.446201 | -26.287103 | -6.6052976 | $<0.0001$ |
| D4 | -21.928267 | -31.76917 | -12.087364 | $<0.0001$ |
| D5 | -27.410334 | -37.251237 | -17.569431 | $<0.0001$ |
| D6 | -32.892401 | -42.733304 | -23.051498 | $<0.0001$ |
| D7 | -38.374468 | -48.215371 | -28.533565 | $<0.0001$ |
| D8 | -43.856535 | -53.697438 | -34.015632 | $<0.0001$ |
| D9 | -49.338602 | -59.179504 | -39.497699 | $<0.0001$ |
| DTen | -54.820668 | -64.661571 | -44.979765 | $<0.0001$ |

Here, we see that the distribution D0 is not significantly different from D1, and maybe not even from D2, but for D3 and beyond, it's very very significant.

## Tukey Analysis

| D1 subtracted from |  |  |  |  |
| :--- | ---: | :---: | ---: | ---: |
|  | Difference | Lower | Upper | P-value |
| D2 | -5.4820668 | -15.32297 | 4.3588361 | 0.781 |
| D3 | -10.964134 | -20.805037 | -1.1232307 | 0.0151 |
| D4 | -16.446201 | -26.287103 | -6.6052976 | $<0.0001$ |
| D5 | -21.928267 | -31.76917 | -12.087364 | $<0.0001$ |
| D6 | -27.410334 | -37.251237 | -17.569431 | $<0.0001$ |
| D7 | -32.892401 | -42.733304 | -23.051498 | $<0.0001$ |
| D8 | -38.374468 | -48.215371 | -28.533565 | $<0.0001$ |
| D9 | -43.856535 | -53.697438 | -34.015632 | $<0.0001$ |
| DTen | -49.338602 | -59.179504 | -39.497699 | $<0.0001$ |
| D2 subtracted from |  |  |  |  |
|  | Difference | Lower | Upper | P-value |
| D3 | -5.4820668 | -15.32297 | 4.3588361 | 0.781 |
| D4 | -10.964134 | -20.805037 | -1.1232307 | 0.0151 |
| D5 | -16.446201 | -26.287103 | -6.6052976 | $<0.0001$ |
| D6 | -21.928267 | -31.76917 | -12.087364 | $<0.0001$ |
| D7 | -27.410334 | -37.251237 | -17.569431 | $<0.0001$ |
| D8 | -32.892401 | -42.733304 | -23.051498 | $<0.0001$ |
| D9 | -38.374468 | -48.215371 | -28.533565 | $<0.0001$ |
| DTen | -43.856535 | -53.697438 | -34.015632 | $<0.0001$ |

Here, we see that the distribution D1 is not significantly different from D2, and maybe not even from D3, but for D4 and beyond, it's very very significant. Since all these distributions were made in a systematic way relative to each other, these values are going to keep repeating!

## Tukey Analysis

| D3 subtracted from |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Difference | Lower | Upper | P-value |

## And yet again...

## Tukey Analysis

| D7 subtracted from |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Difference | Lower | Upper | P-value |
| D8 | -5.4820668 | -15.32297 | 4.3588361 | 1 0.781 |
| D9 | -10.964134 | -20.805037 | $-1.1232307$ | 7 0.0151 |
| DTen | -16.446201 | $-26.287103$ | -6.6052976 | $6<0.0001$ |
| D8 subtracted from |  |  |  |  |
|  | Difference | Lower | Upper | P-value |
| D9 | -5.4820668 | -15.32297 | 4.3588361 | $1 \quad 0.781$ |
| DTen | -10.964134 | -20.805037 | $-1.1232307$ | 7 0.0151 |
| D9 subtracted from |  |  |  |  |
|  | Difference | Lower | Upper | P-value |
| DTen | -5.4820668 | -15.32297 | 4.3588361 | 0.781 |

## And finally...

## What can you do?

Now that you've spent a semester in STAT 202, what can you do that you couldn't do before?

Not knowing what you could do before, I'm guessing many of you can now do these things that are new:

- Figure out a good sample size for a poll you might wish to do.
- Come up with a null and alternative hypothesis in a research setting.
- With software, use LSR and make meaningful statements about correlation
- Add uncorrelated random variables correctly
- Add correlated random variables correctly (or know to avoid it)
- With software, use $\chi^{2}$ analysis correctly for categorical variables
- With software, use ANOVA correctly to tell if groups differ.

## What matters

What matters most is not what you can recall or what you forget. What matters most is what's left after you forget the precise content. You have a better understanding of statistical reasoning. You're less likely to be led astray by bogus arguments. You're not intimidated by statistical language.
You have a vague memory of everything you once knew, and you can look it up again later if you need to know the details again.

## Progression 11

Contingency table results:
Rows: A
Columns: A

| Cell format |
| :--- |
| Count <br> (Expected count) |

|  | false | true | Total |
| :--- | ---: | ---: | ---: |
| false | 36 | 0 | 36 |
|  | $(12.96)$ | $(23.04)$ |  |
| true | 0 | 64 | 64 |
|  | $(23.04)$ | $(40.96)$ |  |
| Total | 36 | 64 | 100 |

Chi-Square test:

| Statistic | DF | Value | P-value |
| :---: | ---: | ---: | ---: |
| Chi-square | 1 | 100 | $<0.0001$ |

THE LAST MEMORY QUESTION
$\leftarrow \rightarrow$ C $\square$
 (T) s/STAT202/Catechism/Stat202_Cat_App/MemoryInOrder.html is

III $\equiv$

## STAT 202 Memory Questions

## Combined Sets

To sign the log and earn credit, you need to work the combined set. You are allowed a maximum of 7 errors. You need to get 50 right in 13 minutes.

Click all correct answers, then click submit:

## What is the correct way to state the the null and alternative hypotheses for an ANOVA test?

The alternative hypothesis states that all the groups are different from each other.

The alternative hypothesis states that at least one group has a different mean from the others.

The null hypothesis states that at least two groups have a common mean value.

The null hypothesis states that all the groups have a common mean value.
